Miracle Mouse

Miracle Mouse was designed to make computers more accessible by giving the user the ability to control mouse and keyboard output using only the rotation of the head.

The user controls the mouse by turning their head in the direction they wish the cursor to move. The response speed of the cursor is adjustable to suit the needs of the user.

Clicking is accomplished by hovering the cursor over the desired object for a user-defined period of time and can be conveniently disabled when not needed. For ease of use, Miracle Mouse uses a two-stage hover sequence. The first stage is used simply to confirm that you wish to click on something. The click is performed at the end of the second hover. The area in which the cursor must remain to allow the hover sequence to execute is also adjustable to accommodate for unsteadiness in head control.

Keyboard control is provided by OnScreen, a robust on-screen keyboard package which makes typing quick and easy. For more information on OnScreen, [click here](#).

The headset on which one of our sensors is mounted molds to fit the user's head after a few sessions. It is lightweight and does not require much muscular strength to move at all. However, steady control of the head is highly recommended as the hardware is ultra-precise and responds to motion as small as a millimeter.

- ▶ Works in conjunction with other assistive technology peripherals easily.
- ▶ Headset molds to the shape of your head over time.
- ▶ Powered by the system, no external power source necessary.
- ▶ Includes software suite which enables complete computer control.
- ▶ All software upgrades are free.
- ▶ Backed by 30 day money-back guarantee & 120 parts warranty.
