

QualiKEY is the ultimate Virtual Keyboard, which allows users with mobility impairments to type data directly into any Windows application. Instead of pushing keys on a physical keyboard, text and commands are entered on QualiKEY's Virtual Keyboard that is displayed on the computer monitor. This windows application is almost identical to the breakthrough Virtual Keyboard available on the QualiWORLD platform. QualiKEY keyboard layouts can be fully customized to maximize and speed up the user's ability to input commands and text.

Layout Designer

Layout Designer allows the user to create, modify and fully personalize virtual keyboards to maximize efficiency and address individual users needs. The user can define and save an unlimited number of application specific new keyboard layouts.

Word prediction

The Word Prediction Feature uses a built-in dictionary to predict which word is being typed, before you type the entire word. Just type the first letter(s) of the word and Word Prediction will instantly show the words that begin with the entered letter(s). This function of QualiKEY reduces the number of keystrokes needed for typing. The list of predicted words is generated from a personal dictionary, which already includes over 20'000 words for each of the 6 available languages. Any new word is automatically added to the dictionary. The predicted words can be shown as most frequently used words, most recently used words or alphabetically.

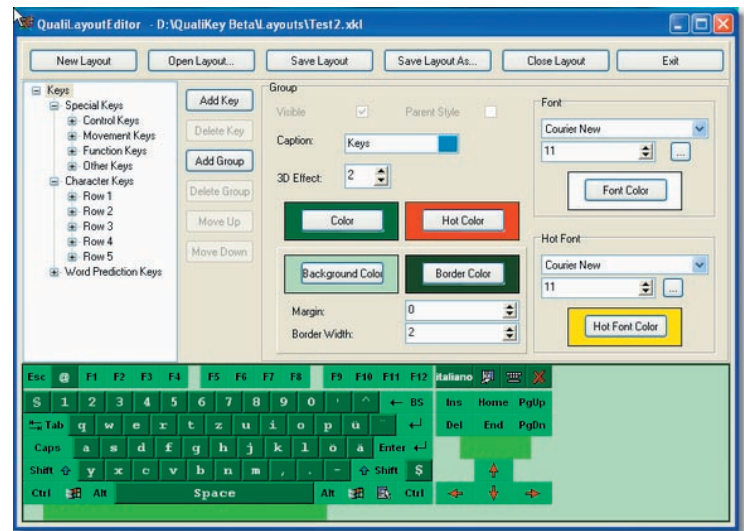

Vocabulary Editor

This QualiKEY feature allows you to modify, add, delete any words in your personal vocabulary. All the words included in Text files can be automatically imported in order to quickly customize and build your vocabulary.

Abbreviation-Expansion

This feature can create or modify Word Abbreviation Expansions. For example: when typing the letters "gm" you could program QualiKEY to expand the abbreviation into the phrase "Good Morning".

QualiKEY's Layout editor gives the user the power to create a layout most suited for their needs
